Abstract

Small and Medium Enterprises (SMEs) are essential contributors to global economic growth, innovation, and employment, yet they face unique barriers in their digital transformation journeys. The emergence of generative artificial intelligence (AI) presents a significant opportunity for SMEs to enhance productivity, strengthen customer engagement, and build competitive advantage. Applications of AI in areas such as process automation, predictive analytics, and personalised services offer potential for innovation and long-term growth. However, adoption remains limited due to persistent challenges, including high implementation costs, shortage of technical expertise, organisational resistance to change, and cybersecurity vulnerabilities. This paper synthesises findings from recent studies (2022–2025) to examine both the opportunities and challenges associated with AI integration in SMEs. The review highlights that while awareness of AI technologies is rising, practical implementation is slow, indicating a critical awareness–adoption gap. To bridge this divide, SMEs must adopt phased and strategic approaches, supported by employee training, enabling policy incentives, and human-centred AI practices that balance technological potential with ethical considerations.

Introduction

Small and midsize enterprises (SMEs) are companies that generally fall between small and large businesses. There is generally a threshold for the revenues, assets, and/or employees held by SMEs. Some industries also define whether a company is small or mid-sized. Each country has a distinct definition of what constitutes a small and midsize enterprise. Though small, SMEs play an important role in an economy. They outnumber

large firms, employ many people, and are generally entrepreneurial. SMEs tend to help to shape innovation.

Small and midsize enterprises can exist in almost any industry but are more likely to operate within industries with fewer employees and smaller up-front capital investments. The most common types of SMEs include legal firms, dental offices, restaurants, and bars.

SMEs are segregated from large, multinational corporations because they fundamentally operate differently. Large, complex firms may require advanced enterprise resource planning (ERP) systems for accounting, supply chain management and financial reporting, and interconnectivity across offices around the world or deeper organisational processes. SMEs, on the other hand, may require fewer systems given their narrower scope of operations.

Generative AI is an artificial intelligence (AI) that can produce content such as audio, text, code, video, images, and other data. While previous AI algorithms were used to identify patterns within a training data set and make predictions, generative AI uses machine learning algorithms to create outputs based on a training data set.

The rise of generative AI is largely due to the fact that people can use natural language to prompt AI now, so the use cases for it have multiplied. Across different industries, AI generators are now being used as a companion for writing, research, coding, designing, and more. And GenAI will continue to evolve as it's trained on more data. There are many generative AI models, including large language models (like ChatGPT), image generation models (like DALL-E), and audio generation models.

Small and medium-sized enterprises (SMEs) can greatly benefit from generative artificial intelligence (AI) tools to streamline operations and improve efficiency. For example, AI tools like ChatGPT can help automate various processes, such as test writing for code, streamlining external communications, creating chatbots, and generating tailored job descriptions. These tools can also provide personalized product recommendations, optimize customer service interactions, and automate threat intelligence briefings, saving time and resources.

Additionally, AI can be used to apply sentiment analysis to online feedback, guide customer service

interactions, and assist in crafting tailored job descriptions. SMEs now have the opportunity to leverage generative AI to transform their operations and compete effectively in the digital age.

Generative AI tools such as ChatGPT and GitHub's Copilot can revolutionize SMEs' operations, allowing them to automate tasks, improve customer service, and optimize operational processes. As generative AI advances, SMEs can harness its potential to drive growth and create a distinct competitive advantage.

The latest technological developments in generative artificial intelligence (GenAI) offer powerful capabilities to small and medium enterprises (SMEs) as they facilitate the democratization of scalability and creativity. With little technical expertise or financial resources, SMEs can leverage this technology to streamline work processes and unleash innovation, improving their product offerings and long-term competitiveness.

The rapid advancements in artificial intelligence (AI) and natural language processing (NLP) have unveiled novel possibilities for addressing the barriers encountered by micro, small, and medium enterprises (MSMEs).

Especially in emerging markets, they make a substantial contribution to regional development, entrepreneurship, and innovation. Notwithstanding their size, SMEs frequently encounter major obstacles like restricted financial access, a lack of qualified personnel, and inadequate technology infrastructure. These limitations threaten their long-term viability and competitiveness in a time characterized by the Fourth Industrial Revolution and digital transformation.

Machine learning enables SMEs to use predictive analytics for better decision-making. By analyzing past data, market trends, and external factors, SMEs can forecast demand, optimize inventory, and set competitive pricing. This reduces stock issues, improves margins, and helps identify new consumer trends, allowing SMEs to allocate resources more strategically and stay ahead in the market. • Process optimization. AI enables SMEs to design tailored products and services by analyzing customer data, speeding up R&D, and reducing guesswork. It supports personalization across marketing, products, and after-sales, boosting customer loyalty. SMEs can also use AI to test new business models, target niche markets, and simulate customer responses, allowing faster innovation. Collaborations with other firms further strengthen knowledge sharing and market reach, enhancing overall competitiveness and the wider innovation ecosystem. <p>Challenges</p> <ul style="list-style-type: none"> • Technical barriers. SMEs face challenges in adopting AI due to limited internal resources and lack of technical expertise. Unlike large firms with R&D teams, SMEs often struggle to choose the right AI tools, face compatibility issues with old systems, and lack the skills to integrate and maintain AI. Continuous upskilling is also required, adding extra strain on their small workforce. • Cost constraints. AI adoption is expensive for SMEs due to high upfront costs for infrastructure and ongoing expenses for staff, data, and system updates. Hiring AI experts adds further strain, and the uncertain return on investment makes leaders hesitant to commit resources. This cost pressure forces SMEs to juggle daily operations with long-term AI investments, highlighting the need for better financial planning and external support. • Data Privacy and security. SMEs face major challenges in meeting strict data privacy and security regulations like GDPR when

			<p>adopting AI. Limited resources make compliance and cybersecurity difficult, and failures can lead to heavy fines, reputational loss, and reduced customer trust. Since AI systems require large amounts of data, SMEs must use strong technical measures and staff training to ensure privacy and security, adopting a “privacy-by-design” approach.</p> <p>Opportunities</p> <ul style="list-style-type: none"> • Enhanced innovation capacity. Despite challenges, AI gives SMEs a powerful chance to boost innovation. With advanced analytics and pattern recognition, they can spot new trends, address unmet customer needs, and speed up product development. AI also helps uncover new customer segments, channels, and business models, while accessible tools allow even non-experts to contribute. This fosters creativity and enables SMEs to achieve “leapfrog development,” overcoming limits of traditional R&D. • Improved competitive advantage AI gives SMEs a competitive edge by enabling real-time data analysis and predictive insights. This helps them anticipate demand, understand customer behavior, and respond quickly to market shifts. As a result, SMEs can make smarter decisions on products, promotions, and service, building stronger customer relationships and standing out against bigger competitors. • Access to new markets. AI helps SMEs expand into new and untapped markets by identifying consumer niches and regional demands through advanced data analysis. Tools like AI-driven translation, localization, and digital marketing make cross-border scaling easier and more affordable. This global reach allows SMEs to diversify revenue, build stronger brands, and secure long-term growth. <p>Strategies</p> <ul style="list-style-type: none"> • Capacity Building Building capacity should also include forming cross-functional teams of employees with diverse backgrounds, working on AI projects. SMEs can bridge the gap by pairing domain experts (such as operations managers or product designers) with data scientists, encouraging knowledge transfer and adoption of a more holistic approach to AI. This cross-pollination of ideas provides a degree of assurance that AI tools created will be aligned with the firm’s strategic goals and operational realities.

			<ul style="list-style-type: none"> • Collaboration and Partnerships Partnerships can help SMEs overcome resource limits. Collaborating with universities gives access to advanced research, labs, experts, and student talent, while also encouraging innovation and experimentation. Working with large corporations provides SMEs with mentorship, data, technical support, and wider market access. Such collaborations not only improve AI adoption but also enhance visibility, credibility, and long-term growth for SMEs. • Policy Support Governments play a key role in helping SMEs adopt AI by creating supportive ecosystems. They can offer financial incentives like grants, tax breaks, and loans, while also setting ethical and sustainability guidelines. Public-private partnerships can further aid SMEs by promoting research, easing technology transfer, and providing guidance on compliance and security
<p>Immo Brüggemann, Dr. Stephan Buse, and Nohemi Villarreal (Source)</p>	<p>2025</p>	<p>How AI can increase resilience in small and medium-sized companies</p>	<p><u>Opportunities</u></p> <ul style="list-style-type: none"> • Phase 1 – Collecting and structuring external data: The challenge is too much unstructured data about the business environment. Generative AI helps by quickly sorting, grouping, and highlighting only the most relevant information (e.g., scanning news feeds and showing only new important topics). This saves time and gives managers a stronger base for decisions. • Phase 2 – Evaluating and integrating internal resources: Much company knowledge is “sticky” (unwritten, hidden in employees’ minds). Generative AI can interact in natural language to extract this knowledge and link it to methods like VRIO. For example, analyzing customer reviews can reveal hidden strengths or weaknesses that leaders didn’t notice before. • Phase 3 – Deriving strategic fields of action: Once external and internal insights are gathered, they are turned into concrete strategies. Humans still play the biggest role here, but generative AI can suggest new ideas by combining patterns in the data. For instance, using the Ansoff Matrix, AI can propose fresh growth opportunities and practical initiatives. • <u>Overall:</u> Generative AI adds value in all phases of strategic management—processing large data, uncovering hidden knowledge, and sparking new ideas—while
